

# Installation & Configuration

**AxCMS.net Installation Webcasts:** [http://en.help.axcms.net/en\\_help\\_cms\\_inst\\_webcasts.AxCMS](http://en.help.axcms.net/en_help_cms_inst_webcasts.AxCMS)

For the installation of AxCMS.net two systems are always necessary: the **Management System** (MS) and the **Live System** (LS).

The communication between these two systems is carried out by the **PublishService**. If you want to use additional modules of AxCMS.net you might have to set up additional systems.

You can set up the Management and Live System according to your requirements:

- on a single local server
- on two different servers in the same network
- on two different servers in different networks (i. e. the Management System in the internal network and the Live System in an external computer center).

This guide starts with a [Quick Start](#) section. Read it, if you want to install our sample project for AxCMS.net on your workstation.

Each step is described in detail in further chapters. This installation guide refers only to installation of our sample project on AxCMS.net 9.0 with given default parameters and directory structure.
